

Is There A Use with regard to Pheromones?

Now I'm not sure if you have ever heard of **pheromones** but there is such a thing. Pheromones as they exist in nature are chemical activates which are secreted by animals which may result in a change in the behavior of some other animal. These chemicals are secreted by numerous glands at various times of the life of the animal. They can be triggered to be able to modulate sexual behavior. Have you ever heard of the statement of a dog in heat? When a female is ovulating and at the time of reproduction male dogs will observe her so that you can lover with her. This only happens at certain times. The key is the release of **chemical compounds** by the female which alerts the males of her condition.

Pheromones Also Affects Hostility Levels in Animals

An aggressive animal may emit chemicals which alerts other animals of their intense intent. They are also used to mark the territory of a dominant male. This alerts the other males that they have entered his place along with the women of the species.

Human Beings Skin is the Organ Which Releases the Pheromones

Their release starts during puberty when the **human body** begins to make most of the hormones that are associated with growth and sexuality as well as are released by glands in your skin.

“ We as human beings can not perceive an smell. Some may confuse the body odor which can be produced by the breaking down of glandular secretions by bacteria with the production of pheromones but they are two different things.

Studies have been done in humans pertaining to the production of pheromones in women and men which seem to indicate higher production of these types of chemical compounds in people at the time of ovulation. Studies have also shown that the production of pheromones will also change in ladies when they are placed in the company of women or all men.

- The perfume industry has capitalized on the production and function of pheromones for quite a few years.
- I am not sure if pheromones can be added to fragrance since some claim for a number of reasons.
- The first of which is that they are produced naturally by the body.
- Any kind of make an effort to duplicate them in a laboratory is questionable.
- It might be possible but as far as I'm concerned this is highly questionable.
- Is it possible to reproduce the precise chemical combinations found in nature?
- Maybe it is but it is highly doubtful.

PheromonesHuman BodyChemical Compounds

When the data of pheromones was relatively new there would be commercials on television advertising their use as well as effects when used in perfumes and colognes but have you noticed that these advertisements have all but disappeared. I recently don't think that these effects can be replicated and put into a perfume or cologne.

Many Years Ago I Owned a Retail Establishment on an Army Installation in Georgia

One year many of the troops there had been deployed to Egypt for a protracted training exercise. When they came back many of them have been asking me for a fragrance called Secret of the Desert. Their claim was that when they utilized this fragrance it actually caused women to become open to be able to sexual intercourse. There were so many who claimed that they had used this fragrance and that it had in fact worked for them in which I decided that it was worth investigating.

When i would some research I came across this particular fragrance listed as one of the scented oil scents sold by Egyptian vendors. The actual fragrance that was called Secret of the Desert was none other than their own version of Channel #5. The actual hype has been created by the vendors in order to make a lot more sales to the gullible soldiers as well as the Egyptians used sex as a selling application. In light of this I would advise you to be wary of any scented product which promises that it will cause the opposite sex to be attracted to a person. Scent Acrylic Express.
